

# Universal lighting module

## WLU-A1, WLU-B1, WLU-D1 for firmware 4.x

### Module properties:

- 16 / 8 / 6 LED outputs
- Function / accessory decoder
- adjusting 31 light effects
- individual and global brightness adjustment
- set the switch-on delay time
- set the switch-off delay time
- selects random switching on and off
- setting a random generator delay
- assigning a random generator to the Fn
- speed setting global effects
- support of function keys F0 - F28

LEDs can be connected directly to outputs on the decoder. However, it is always necessary to properly use the wires to each LED, avoiding damage to individual outputs or the destruction of the entire module. When you first connect the supply voltage to illuminate all LEDs (test in functionality the lighting) and the decoder is reset to the factory settings (TAB1, RST column). To manually set the decoder you can set individual CV in table TAB1. After you set the decoder, it is possible to lock the write to the CV. Entry is locked by entering a value of 248 in CV8 and unlocked by entering the decoder address from CV1 to CV8 (TAB8). Reset the decoder by writing the value 246 to CV8 (TAB8). Write any value to CV8 to make the setting in Table 8, but CV8 (manufacturer) does not change.

The decoder can be set for a short or a long address with bit 5 in CV29 (TAB2). The ideal is to set the same address as the locomotive (CV1 or CV17 + CV18) or use consist address, that can be changed during use CV19 (programming POM). Then, you can fully take advantage of features that are dependent on the movement of the sets (CV150-CV157). For the correct functioning of the Fn0 on the 14 speed steps, it is necessary to reset the bit 1 in CV29 (TAB2). Switching on the lights according to the polarity of the DCC can be set in the CV158 to CV161. The module can be used with the restrictions on the analog track by setting the kill bit 2 in CV29 (TAB2). This bit is set in the factory. In the same way it is possible to use the module for a variety of lighting model of the country, buildings, street, etc. Setting bit 7 in CV29 (TAB2a) switches the module to the accessory decoder. CV13, CV14, CV17-19, CV119, CV128-CV145 and CV150 to CV161 are not used in this setting and will be ignored. In table TAB1b, there is a CV listing that is different than in a functional decoder mode. If bit 0 in CV27 (TAB2b) is set, the decoder will remember the output settings. Bit 3 in CV27 (TAB2b) determines how the decoder will respond to received packets (straight / turn, or turn / straight). The decoder will occupy 4 consecutive addresses. The addressing for accessories depends on the manufacturer (Lenz / Roco). The decoder hardware address is set by writing 6 lower bits to CV1 and writing 3 upper bits to CV9, or by the following procedure:

1. Write value 255 to CV9 via DCC programmer
2. Set the address in to DCC command station to be programmed
3. Send accessory command (switchover)
4. When the module receives a signal, it is programmed and the outputs flash
5. The programming mode is terminated automatically

For all the outputs it is possible to adjust the brightness levels to 31 values (CV46-CV61). A value 0 and 31 represents the maximum brightness value 1 represents the minimum brightness. Writing the value 0 to 31 to CV8 is brightness output set globally for all outputs. Assign each a functional keys F0-F12 is configured in CV120-CV145. For each function key is reserved for a pair of CV (TAB4). If necessary, you can change the assignment of the function keys F5 - F28 by changing the CV119 (TAB9).

Power-on delay time (CV66, CV68) and off delay (CV67, CV69) sets up in seconds (0-255 seconds). Outputs are dependent on the delays are set in CV166 to CV173. Outputs that randomly switch when stops are set in CV154 and CV155. Outputs that randomly switch on while driving are set in CV156 and CV157. The rate of generation of random switching on and switching off can be set up in seven levels in CV70 and in CV71 (TAB6). The ratio of random output on / off can be set in the CV72 and CV73 (TAB7). If the value is set to 10, then the lights will only randomly switch on . If the value is 0, the lights will then only randomly switch off . CV154 to CV165 shall be subject to the relevant output up by turning on the CV120 CV145. Identical output on/off setting with a delay of 1 and 2 is not appropriate. Via CV74 to CV77 shall be assigned a random generator to the individual functions F0 to F12 (TAB5). CV78 and CV79 are used to delay the startup of a random generator. The value is entered in seconds. It is possible to make sure that when switched on, all lights turn on and, after a set time, they will randomly turnoff. The value 0 means that this function is off.

**TABI** List all CVs

**Technical specifications:**

Number of outputs: WLU-A1 (16 outputs), WLU-B1 (8 outputs), WLU-D1 (6 outputs)  
 Dimensions : WLU-A1 (15 x 62 x 4mm), WLU-B1 (13 x 34 x 3mm), WLU-D1 (9 x 23 x 4mm)  
 Power DCC : 10-20V  
 Power analog : 4-20V (full brightness at 5.3V)  
 Energy consumption: WLU-A1 (max 0,05A), WLU-B1 (max 0,03A), WLU-D1 (max 0,02A)  
 Output Load: 3mA  
 Operating temperature: 5 - 50 °C

  
 DIGITÁLNE VLÁČIKY

**Záručné podmienky:**

Záručné podmienky sa vzťahujú na poruchy spôsobené pri výrobe a poruchy osadených súčiastok. Na poruchy vzniknuté hrubým zaobchádzaním, nesprávnou montážou, nevhodným uskladnením a pôsobením okolitého prostredia sa záruka nevzťahuje. Po životnosti odovzdajte do zberne elektro odpadu!
